www.domain-name.com In this tutorial, you will learn how Binary Search sort works. Also, you will find working examples of Binary Search in C, C++, Java and Python.

ADVERTISEMENTS

Binary Search is a searching algorithm for finding an element's position in a sorted array.

In this approach, the element is always searched in the middle of a portion of an array.

Binary search can be implemented only on a sorted list of items. If the elements are not sorted already, we need to sort them first.

Binary Search Working

Binary Search Algorithm can be implemented in two ways which are discussed below.

Search tutorials and examples

www.domain-name.com

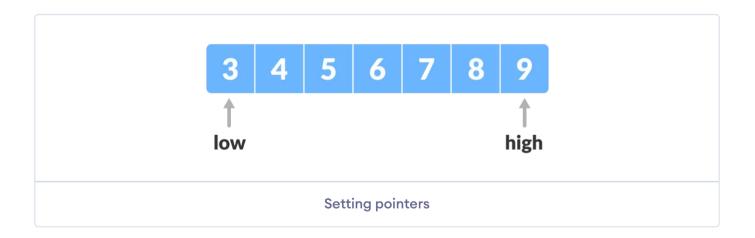

The general steps for both methods are discussed below.

1. The array in which searching is to be performed is:

Let x = 4 be the element to be searched.

2. Set two pointers low and high at the lowest and the highest positions respectively.

3. Find the middle element mid of the array ie. [arr[(low + high)/2] = 6].

www.domain-name.com

Mid element

- 4. If x == mid, then return mid. Else, compare the element to be searched with m.
- 5. If x > mid, compare x with the middle element of the elements on the right side of mid. This is done by setting x = mid + 1.
- 6. Else, compare x with the middle element of the elements on the left side of mid.

 This is done by setting high to high = mid 1.

7. Repeat steps 3 to 6 until low meets high.

8. x = 4 is found.

```
wnile low <= nign:
    mid = low + (high - low)//2

if array[mid] == x:
    return mid

elif array[mid] < x:
    low = mid + 1

else:
    high = mid - 1

return -1

array = [3, 4, 5, 6, 7, 8, 9]
x = 4

result = binarySearch(array, x, 0, len(array)-1)

if result != -1:
    print("Element is present at index " + str(result))</pre>
```

```
mid = low + (high - low)//2

# If found at mid, then return it
if array[mid] == x:
    return mid

# Search the left half
elif array[mid] > x:
    return binarySearch(array, x, low, mid-1)

# Search the right half
else:
    return binarySearch(array, x, mid + 1, high)

else:
    return -1

array = [3, 4, 5, 6, 7, 8, 9]
x = 4

result = binarySearch(array, x, 0, len(array)-1)
```

Binary Search Complexity

ADVERTISEMENTS

Search tutorials and examples

www.domain-name.com

- Average case complexity: 0(log n)
- Worst case complexity: 0(log n)

Space Complexity

The space complexity of the binary search is [0(1)].

Binary Search Applications

- In libraries of Java, .Net, C++ STL
- While debugging, the binary search is used to pinpoint the place where the error happens.
